

# Instagram User Analytics

## Project Description:

In order to help the Instagram product team and the product manager answer the questions posed by the management team, it is my project to find out the analytics and provide insights of the given dataset to the management team. MySQL Workbench was used to complete this project. For this project, I will need to find the 5 oldest users to find the users who have never posted a single photo on Instagram, the contest winner their details, the top 5 most commonly used hashtags on the platform, the day of the week do most users register on, average user posts on Instagram along with the total number of photos on Instagram/total number of users and finally, users (bots) who have liked every single photo.

## Approach:

To approach this project, I began by fully comprehending the requirements and objectives of this project. Following this, I began executing the project with an adaptable mindset, exploring diverse approaches to accomplish the task. After evaluating various options, I selected the most suitable approach to continue with the project. I then proceeded to write and implement the queries to produce the correct, comprehensible output. Overall, I am confident with the project's outcome and consider it a success.

## Tech-Stack Used:

MySQL Workbench with the latest released Version 8.0 Community Edition.

I used it because MySQL Workbench is a visual database design tool that combines SQL development, administration, database design, creation, and maintenance into a single development environment.

## Insights:

I surmise that the dataset contains a lot of data, and that it is necessary to analyse it before continuing. I also infer that the data is distributed in a specific way, and that understanding the distribution is required before proceeding.

## A. Marketing:

### 1. Rewarding Most Loyal Users:

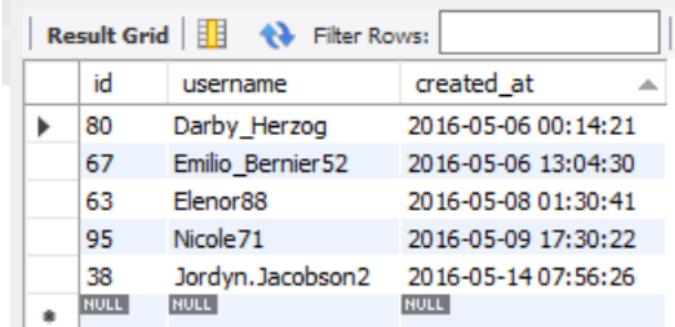

Here, I need to find the 5 oldest users of the Instagram from the given database.

For fulfilling the required query, I selected id, username, created\_at column from the users table and order by created\_at column in ascending order with limit of 5

#### SQL Statement :

```
SELECT
    id, username, created_at
FROM
    users
ORDER BY created_at ASC
LIMIT 5;
```

#### Result:

The screenshot shows a 'Result Grid' window with a 'Filter Rows' input field. The grid displays the results of the SQL query, showing the first 5 rows of the 'users' table ordered by 'created\_at' in ascending order. The columns are 'id', 'username', and 'created\_at'. The rows are: 80 (Darby\_Herzog, 2016-05-06 00:14:21), 67 (Emilio\_Bernier52, 2016-05-06 13:04:30), 63 (Elenor88, 2016-05-08 01:30:41), 95 (Nicole71, 2016-05-09 17:30:22), and 38 (Jordyn.Jacobson2, 2016-05-14 07:56:26). A sixth row with NULL values is also visible.

	id	username	created_at
▶	80	Darby_Herzog	2016-05-06 00:14:21
	67	Emilio_Bernier52	2016-05-06 13:04:30
	63	Elenor88	2016-05-08 01:30:41
	95	Nicole71	2016-05-09 17:30:22
	38	Jordyn.Jacobson2	2016-05-14 07:56:26
✱	NULL	NULL	NULL

#### Conclusion:

Users having IDs 80, 67, 63, 95, and 38 are the oldest users on the platform.

## 2. Remind Inactive Users to Start Posting:

Here, I need to find the users who have never posted a single photo on Instagram.

For fulfilling the required query, I selected username from users table, then I used left join function to join users table with photos table on user.id = photos.user\_id, then I used where function with condition photos.id is null.

### SQL Statement:

```
SELECT
    username
FROM
    users
LEFT JOIN photos
    ON users.id = photos.user_id
WHERE photos.id IS NULL;
```

### Result – User List

1	username
2	Aniya_Hackett
3	Kasandra_Homenick
4	Jaclyn81
5	Rocio33
6	Maxwell.Halvorson
7	Tierra.Trantow
8	Pearl7
9	Ollie_Ledner37
10	Mckenna17
11	David.Osinski47
12	Morgan.Kassulke
13	Linnea59
14	Duane60
15	Julien_Schmidt
16	Mike.Auer39
17	Franco_Keebler64
18	Nia_Haag
19	Hulda.Macejkovic
20	Leslie67
21	Janelle.Nikolaus81
22	Darby_Herzog
23	Esther.Zulauf61
24	Bartholome.Bernhard
25	Jessyca_West
26	Esmeralda.Mraz57
27	Bethany20

### Conclusion:

This is list of users(usernames) who never posted a single photo on Instagram is given in the user list below. After seeing this data, we can conclude that a total of 26 people present in the database never posted any photos on the platform.

### 3. Declaring Contest Winner:

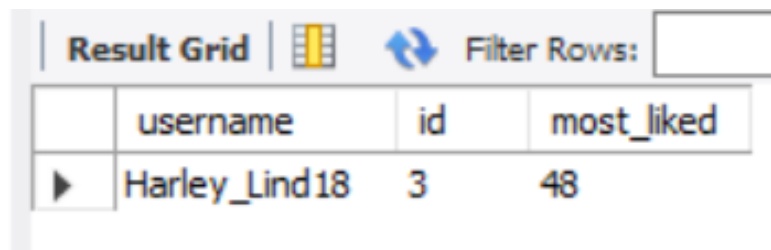

Here, I need to identify the contest winner and provide their details to the team.

For that, I have selected (username, id) from users, count(\*) as most\_liked from likes table the I use inner join function to join likes table with users table on users ON users.id=likes.user\_id then I use group by on photo\_id and then I use order by function on most\_liked in descending order with limit 1.

#### SQL Statement:

```
SELECT
    users.username, users.id, COUNT(*) AS most_liked
FROM
    likes
INNER JOIN
    users ON users.id = likes.user_id
GROUP BY photo_id
ORDER BY most_liked DESC
LIMIT 1;
```

#### Result:

The screenshot shows a database interface with a 'Result Grid' tab. The grid displays the results of the SQL query. The first row shows the user 'Harley\_Lind18' with photo ID '3' and 48 likes. The interface includes a 'Filter Rows' button and a search input field.

	username	id	most_liked
▶	Harley_Lind18	3	48

#### Conclusion:

We learned that photo id 3, which gets the most likes of 48, belongs to the user 'Harley\_Lind18'. So, Harley\_Lind18 is the winner of the contest.

#### 4. Hashtag Resercher:

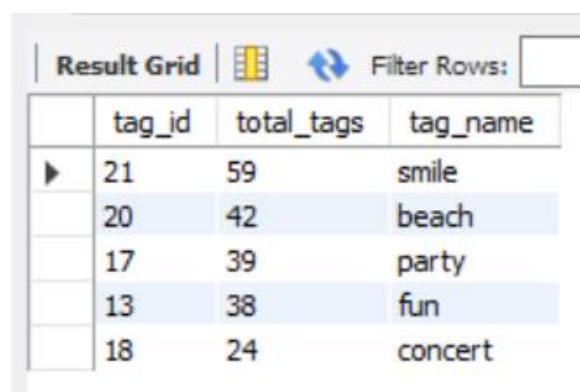

Here, I need to Identify and suggest the platform's top 5 most commonly used hashtags.

For that, I have selected tag\_id, count (photo\_id) as total\_tags from photo tags table, and then I used join function to join tags table with photo tags table on tags.id = photo\_tags.tag\_id, I used group by function on tag.id, and then I used order by function on total in descending order with limit 5.

##### SQL Statement:

```
SELECT  
tag_id, COUNT(photo_id) AS total_tags,  
tag_name FROM photo_tags  
JOIN tags ON tags.id = photo_tags.tag_id  
GROUP BY tag_id  
ORDER BY total_tags DESC  
LIMIT 5;
```

##### Result:

The screenshot shows a 'Result Grid' window with a table containing 5 rows of data. The columns are 'tag\_id', 'total\_tags', and 'tag\_name'. The rows are ordered by 'total\_tags' in descending order. The first row is '21', '59', 'smile'. The second row is '20', '42', 'beach'. The third row is '17', '39', 'party'. The fourth row is '13', '38', 'fun'. The fifth row is '18', '24', 'concert'.

	tag_id	total_tags	tag_name
▶	21	59	smile
	20	42	beach
	17	39	party
	13	38	fun
	18	24	concert

##### Conclusion:

The top 5 popular tags used on Instagram are – smile, beach, party, fun, and concert, with total tag counts of 59, 42, 39, 38, 24, respectively.

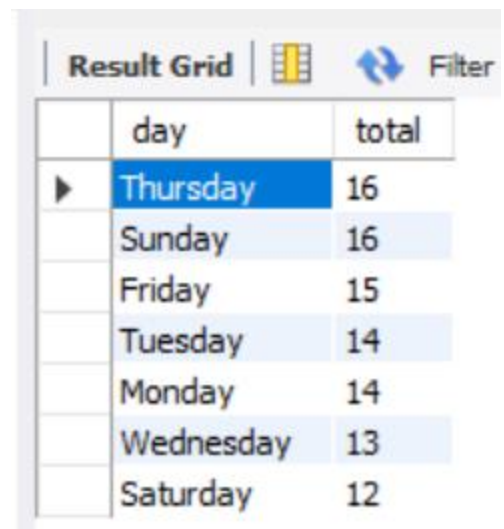

## 5. Launch AD Campaign:

Here, I need to identify on what day of the week do most users register on and provide insights to the management team on when to schedule an ad campaign.

### SQL Statement:

```
SELECT  
DAYNAME(created_at) AS day,  
COUNT(*) AS total  
FROM users  
GROUP BY day  
ORDER BY total DESC;
```

### Result:

The screenshot shows a 'Result Grid' interface with a table of user registration counts by day. The table has two columns: 'day' and 'total'. The rows are ordered by the total count in descending order. Thursday and Sunday both have a total of 16, which is the highest. Friday has 15, Tuesday and Monday have 14, Wednesday has 13, and Saturday has 12.

	day	total
▶	Thursday	16
	Sunday	16
	Friday	15
	Tuesday	14
	Monday	14
	Wednesday	13
	Saturday	12

### CONCLUSION:

With the above query, we learned that most users (16) registered on Thursday and Sunday. So, either is the best day to schedule an ad campaign. Since Thursday is on top, we suggest moving forward with Thursday as the best day to schedule an ad campaign.

## B) Investor Metrics:

### 1. User Engagement:

Here I need to find how many times does an average user posts on Instagram, and provide the total number of photos on Instagram/total number of users.

This problem can be solved in two parts:

1.1. 1st Part: Finding the total no. of photos and total no. of users on the platform.

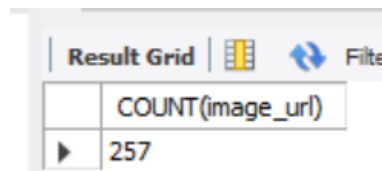

Here, I selected count command to count the numbers of images form the table photos.

#### SQL statement:

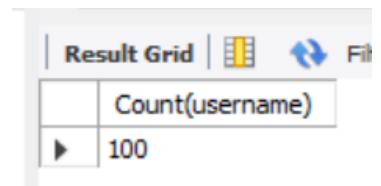

```
SELECT COUNT(image_url)
FROM photos;
```

```
SELECT Count(username)
FROM users;
```

#### Result:

Result Grid		Filter
	COUNT(image_url)	
▶	257	

Result Grid		Filter
	Count(username)	
▶	100	

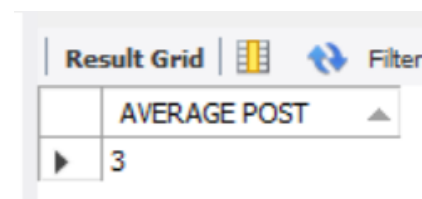

1.2. 2<sup>nd</sup> Part: Finding the average user post on the platform.

Here, I selected Floor command returns the largest integer value that is smaller than or equal to a number. Then I proceeded with count command of the distinct ids from the photos table and divided with the another selected another count command of distinct user\_id from table photos and passed it to show output as average post.

#### SQL statement:

```
SELECT FLOOR (
(SELECT COUNT(DISTINCT id) FROM photos)
/
(SELECT COUNT(DISTINCT user_id) FROM photos))
AS "AVERAGE POST";
```

#### Result:

Result Grid		Filter
	AVERAGE POST	
▶	3	

#### Conclusion:

From the above result, we can conclude that an average posts per user is around 3.

## 2. Bots & Fake Accounts:

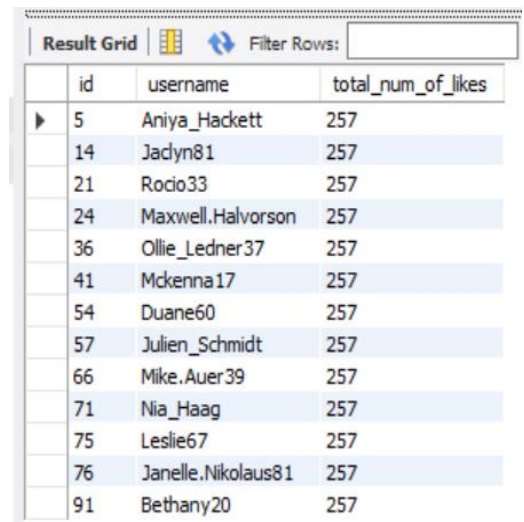

Here, I need to find and provide data on users (bots) who have liked every single photo on the site.

For that, I first selected user.id, username, and count function as total\_likes\_by\_user from users table, then I used join function to join users table with likes table on users.id=likes.user\_id, later I used group by function for user.id and having function with condition total\_likes\_by\_user = select statement for count (\*) from photos table.

### SQL statement:

```
SELECT
users.id, username, COUNT(users.id) AS total_num_of_likes
FROM users
JOIN
      likes ON users.id = likes.user_id
GROUP BY users.id HAVING total_num_of_likes = (SELECT
COUNT(*)
FROM photos);
```

### Result:

	id	username	total_num_of_likes
▶	5	Aniya_Hackett	257
	14	Jadyn81	257
	21	Rocio33	257
	24	Maxwell.Halvorson	257
	36	Ollie_Ledner37	257
	41	Mckenna17	257
	54	Duane60	257
	57	Julien_Schmidt	257
	66	Mike.Auer39	257
	71	Nia_Haag	257
	75	Leslie67	257
	76	Janelle.Nikolaus81	257
	91	Bethany20	257

### Conclusion:

There is a total of 257 photos available on the platform, and from the above result we can conclude that around 13 users come in the category of bots as they have liked every single picture available on the platform.

**Result:**

While working on the project on Instagram user analytics, I made significant progress. Understanding the fundamentals of SQL and learning how to use it effectively have been very helpful to me. I was able to examine Instagram users' data and their posts. This has made it easier for me to comprehend how Instagram users behave and interact with one another. It has significantly aided me in developing my abilities and knowledge. I now have a better understanding of how to analyse data using SQL. I've also improved my ability to concisely and clearly explain my findings to others. I believe that this project has greatly benefited me and improved my communication skills.
